Fortune Max-Eguakun

Senior Full-Stack Engineer · Python/Django · Vue/TypeScript · PostgreSQL · LLM features in production · AI-native development

Barcelona, Spain (open to remote) · fme.dev/contact · fme.dev · LinkedIn · GitHub

SUMMARY

Senior full-stack engineer (programming since 2014) who owns systems end to end. As lead (and for a stretch, sole) engineer of a regulated VC/fintech platform (~€97M raised), I proposed, led and built its full rewrite and cloud migration, cutting infrastructure cost ~95%. I ship LLM features that the business runs on (automated reporting, RAG, an MCP server for the whole business team), and I build agentically to deliver at the scale of a much larger team.

EXPERIENCE

OneRagtime — Barcelona, Spain

Senior Full-Stack Developer (Sep 2025 – Present) · **Full-Stack Developer** (Apr 2024 – Aug 2025) · **Full-Stack Developer Intern** (Apr 2023 – Apr 2024)

VC investment platform (~€97M raised across 6 funds and club deals; ~450 active investors; 70+ SPVs) with regulated KYC/AML, payments and e-signature flows. As the engineering team shrank from 7 to 2 to 1, I took on end-to-end ownership: sole engineer from Sep to Nov 2026 (delivery, infrastructure and business-team support), now onboarding a new engineer. ~6,700 commits; top contributor to the current codebase.

Platform rewrite (proposed, led and built)

- Proposed, led and built the rewrite of an 8-year-old Django 4/MySQL monolith into a Django 6 · PostgreSQL · Vue 3 monorepo. I designed the data model (154 → 101 tables), design system and frontend architecture, built the platform to feature parity, and migrated hosting from AWS to Railway/Vercel, **cutting infrastructure cost ~95%**.
- Ran an incremental strangler-fig migration: new SPAs on the legacy API first, then a new backend over the legacy tables with a KPI parity harness (**99.1% match**), then an idempotent 27-step MySQL → Postgres ETL, then DNS cutovers one surface at a time. Investors only had to log in once more.
- Ported the 23-route investor platform to Vue 3 in 4 days using spec-driven vertical slices. Rebuilt the valuation engine (**minutes → 0.3 s** per startup) and the KPI dashboard (**18 s → 2 queries**).
- Built per-PR preview environments (an isolated backend seeded from a nightly prod snapshot, plus a Vercel preview on a stable URL), zero-downtime deploys (health-gated rollout, graceful worker draining) and a ~4,100-test CI suite.

AI / LLM features

- Built an LLM reporting pipeline (Gemini, runtime-generated Pydantic schemas, source-cited KPIs, Notion API) that drafts **~95% of quarterly portfolio reports**. Analyst time per report went from ~4 h to a 10–15 min review, saving **~100 analyst-hours per quarter**.
- Built hybrid semantic search (RAG) over **170k+ emails, notes and decks**: Gemini embeddings in pgvector HNSW, fused with Postgres full-text search via Reciprocal Rank Fusion, with live Gmail ingestion through Celery.
- Designed and shipped the company MCP server (TypeScript, Streamable HTTP), used by the **entire 12-person business team** to query live platform data and company knowledge through Claude: investor briefings, contact history, investments, and who we know at a company. It projects only the fields a question needs, remaps field names models commonly guess wrong, and caps query size and time.

Product & integrations

- Delivered KYC/AML/FATCA onboarding (6 FATCA classifications, UBO declarations), Mangopay KYC and wallet flows, capital-account statements and an SPV management API with bulk annual-document sends.
- Automated investor subscription and SPV signing with the DocuSign eSignature API (anchor-based fields across template versions, prefill, webhooks). Volume grew from ~20 envelopes a year to **200–300 a year**.
- Built a two-way Pipedrive CRM ⇄ platform sync: a webhook-driven state machine that creates users, investments and data-room folders as deals move stage, with field validation and automatic stage rollback.
- Built a staff GraphQL API with a self-serve export builder, a Slack operations bot, Google SSO/OTP auth with token versioning, and a Chrome extension for one-click deal capture.

Skylight (University of Benin) — Nigeria / Remote

Technical Lead & Creator (Jun 2019 – Present)

- Built and still run the academic records platform used by **5 engineering departments**: registration, results, GPA/CGPA and senate broadsheets. It replaced a shared MS Access database and turned weeks of manual reporting into one click.
- Rebuilt it in 2024–26 (Django 5/DRF, Nuxt 3, Railway, GitHub Actions): redesigned the UI, migrated legacy data and curricula (BMAS → CCMAS), and made each department a thin git-submodule deployment of one shared codebase.

Harbour.Space University — Barcelona, Spain

Front-End Developer (Jan 2023 – Apr 2023): built features for the Student.Space platform (Next.js, React, TypeScript).

Bank of America — Dublin, Ireland

FICC Rates Technology Intern (Jul 2019 – Dec 2019): built a trade-aggregation dashboard across booking systems (React, Redux, Python) and contributed to the bank-wide Python 2 → 3 migration.

SELECTED PROJECTS

- **CloudStation3** (MEng capstone, GitHub · demo), cloud game streaming: emulator frames → shared memory → NVENC H.264 → WebRTC to the browser, with gamepad input sent back as a virtual Linux joystick (C++, Python, Vue).
- **ThinClaw**, a multi-user agentic AI assistant in private beta (TypeScript, ~38k LOC, 840+ tests, overview): sandboxed per-user code execution, encrypted secrets, multi-model with automatic fallback, exactly-once scheduled agent runs, role-based access.
- **FortFund**, a donor-funded savings-incentive app in production for ~2.5 years: time-weighted reward engine, USD-pegged balances, automated bank payouts (FastAPI, Postgres, Nuxt 3).

EDUCATION

- **Harbour.Space University**, Barcelona: Master of Engineering (MEng), Front-End Development major, Data Science minor. GPA 92.7/100 (3.63/4.0). 2022 – 2024. Capstone: CloudStation3.
- **University of Benin**, Nigeria: B.Eng Mechanical Engineering, GPA 4.2/5.0 (2021). Published final-year project on a series-hybrid electric vehicle.

AWARDS

TON Blockchain Bug Bounty: critical FunC compiler bug, $2,400 (2022) · TON Smart Challenge 3: 5/5 tasks, $2,000 (2022) · Google HashCode 2022: 3rd in Nigeria & Ireland · GDG Dublin DevFest Hackathon: 1st place (2019) · IEEExtreme 11.0: 3rd in Nigeria (2017)

SKILLS

Languages: Python, TypeScript/JavaScript, SQL, C/C++, Kotlin, Shell
Backend: Django/DRF, FastAPI, Celery, GraphQL, REST, Node/Express · **Frontend:** Vue 3, Nuxt, React/Next.js, Pinia, PrimeVue, Tailwind, Vite, Cypress
Data & AI: PostgreSQL (pgvector, FTS), MySQL, Redis, RAG/hybrid search, LLM structured output, MCP, Gemini/OpenAI/Anthropic APIs, Claude Code
Infra: Docker, Railway, Vercel, AWS, GitHub/GitLab CI, Sentry, WebRTC, FFmpeg · **Fintech:** KYC/AML/FATCA, Mangopay, DocuSign, SPVs & fund ops, CRM integrations
